Education	Princeton University , Princeton, NJ <i>Ph.D.</i> in Computer Science Thesis: <i>A Serverless Architecture for Application-Level Orchestration</i>	2017-2023
	Duke University , Durham, NC <i>B.S.E.</i> in Electrical and Computer Engineering Minor in Math	May 2015
Interests	I am broadly interested in systems, with both research and industry experiences in cloud computing, serverless systems, virtualization, orchestration, distributed systems, and Linux device drivers.	
Work Experience	PhD in Computer Science Princeton University <ul style="list-style-type: none">Projects and publications in serverless computing using AWS and GCP, light-weight virtualization, and Android security on the ARMv7 instruction set	2017 - 2023
	Software Engineer Nimble Storage, Inc. <ul style="list-style-type: none">Developed and maintained the Linux device driver for the new Gen 6 Fibre Channel chipsetServed as the liaison with Broadcom's Fibre Channel team by leading and tracking collaborative projects	2015 - 2017
Projects	Unum An orchestration system for large-scale serverless applications built on top of existing cloud services on AWS and Google Cloud Platform. Unum tackles many distributed systems challenges including consistency, exactly-once execution guarantees, and fault-tolerance. It improves programmability for complex serverless applications while significantly reducing latency and costs compared with existing orchestrators.	
	SnapFaaS A light-weight virtual machine based on the Firecracker VM by AWS Lambda. SnapFaaS leverages a snapshotting technique to quickly restore VM states and reduce cold-start latency. SnapFaaS minimizes snapshot sizes and restoration latency by carefully identifying memory pages that are actually useful for application execution. SnapFaaS examines all stages of the VM boot process, including kernel loading, operating system init, language runtime setup, and application-specific initialization.	
	SandTrap A dynamic information-flow tracking system on Android that performs native code taint tracking on the ARMv7 instruction set. SandTrap extends information flow control beyond JVM to native code by emulating ARMv7 instructions. SandTrap leverages memory domain to enforce per-thread memory page access privileges to preserve parallelism and minimize latency overhead.	
Skills	Python, Rust, JavaScript, Java, C, Kubernetes, Docker, KVM, AWS (Lambda, DynamoDB), GCP (Cloud Functions, Firestore), Azure (Azure Functions, Durable Functions), Linux device drivers	
Publications	Doing More with Less: Orchestrating Serverless Applications without an Orchestrator <u>David H. Liu</u> , Amit Levy, Shadi Noghabi, Sebastian Burckhardt	

Proc. 20th Symposium on Networked Systems Design and Implementation (NSDI '23), Boston, MA, April 2023

How Low Can You Go? Practical cold-start performance limits in FaaS
