EDUCATION	Princeton University , Princeton, NJ Ph.D. in Computer Science Thesis: A Serverless Architecture for Applicate Advisors: Amit Levy, Michael Freedman	2017 - 2023
	Duke University , Durham, NC B.S.E. in Electrical and Computer Engineering Minor in Mathematics	2011 - 2015 g
WORK EXPERIENCE	 PhD in Computer Science Princeton University, SNS Network Systems Computer Systems in distributed ization, mobile security and privacy: 	
	 A novel distributed orchestration system for large-scale serverless applications that ensures consistency and complex patterns without requiring a centralized service. The system empowers users to build custom data-flow patterns on the application-level and is compatible with a variety of distributed services including NoSQL databases, message queues, and object stores. Unum works on and is portable across AWS and GCP. A light-weight virtual machine that optimizes snapshot memoization and restoration based on the Firecracker VM by AWS Lambda. The system achieves up to 10x improvement in cold start latency compared with other state-of-the-art solutions. A new Android operating system that performs dynamic information-flow tracking on both Java and native code. The system preserves parallelism and minimizes latency overhead of the added security measures by proposing a new approach that leverages ARMv7 Memory Domains to enforce per-thread memory page access privileges. 	
	 Research Intern Microsoft Research, Mobility and Networking Built and evaluated serverless systems an Service (AKS) 	-
	 Software Engineer Nimble Storage, Data Protocol Team Developed firm's Linux device driver for 	2015 - 2017 the new Gen 6 Fibre Channel chipset
	• Firm's liaison with Broadcom; led and tracompanies	cacked collaborative projects across
SKILLS	Python, Rust, C, Go, JavaScript, Java, Kubo MongoDB, Spark, AWS, GCP, Azure, Linux k

SELECTED Uni

PROJECTS

Unum

An orchestration system for large-scale serverless applications built on top of existing cloud services on AWS and Google Cloud Platform. Unum tackles many distributed systems challenges including consistency, exactly-once execution guarantees, and fault-tolerance. It improves programmability for complex serverless applications while significantly reducing latency and costs compared with existing orchestrators.

SnapFaaS

A light-weight virtual machine based on the Firecracker VM by AWS Lambda. Snap-FaaS leverages a snapshotting technique to quickly restore VM states and reduce coldstart latency. SnapFaaS minimizes snapshot sizes and restoration latency by carefully identifying memory pages that are actually useful for application execution. SnapFaaS examines all stages of the VM boot process, including kernel loading, operating system init, language runtime setup, and application-specific initialization.

SandTrap

A dynamic information-flow tracking system on Android that performs native code taint tracking on the ARMv7 instruction set. SandTrap extends information flow control beyond JVM to native code by emulating ARMv7 instructions. SandTrap leverages memory domain to enforce per-thread memory page access privileges to preserve parallelism and minimize latency overhead.
